## Please amend paragraph [0021] as follows:

[0021] The erythropoietin protein may also be an analog having at least one additional amino acid at the carboxy terminal end of the glycoprotein, wherein the additional amino acid includes at least one glycosylation site. The additional amino acid may comprise a peptide fragment derived from the carboxy terminal end of human chorionic gonadotropin. Preferably, the glycoprotein is an analog selected from the group consisting of (a) human erythropoietin having the amino acid sequence, Ser Ser Ser Ser Lys Ala Pro Pro Pro Ser Leu Pro Ser Pro Ser Arg Leu Pro Gly Pro Ser Asp Thr Pro IIe Leu Pro Gln (SEQ ID NO: 38), extending from the carboxy terminus; (b) the analog in (a) further comprising Ser Asn Thr Pro EPO; and (c) the analog in (a) further comprising Asn Thr Val Asn Thr (SEQ ID NO: 6)-EPO.

Please amended paragraph [0022] as follows:

[0022] The erythropoietin protein may also be an analog having an amino acid sequence which includes a rearrangement of at least one site for glycosylation. The rearrangement may comprise a deletion of any of the N-linked carbohydrate sites in human erythropoietin and an addition of an N-linked carbohydrate site at position 88 of the amino acid sequence of human erythropoietin. Preferably, the glycoprotein is an analog selected

> from the group consisting of Gln<sup>24</sup> Ser<sup>87</sup> Asn<sup>88</sup> Thr <sup>90</sup> (SEQ ID NO: 9) EPO; Gln<sup>38</sup> Ser<sup>87</sup> Asn<sup>88</sup> Thr<sup>90</sup> (SEQ ID NO: 9) EPO; and Gln<sup>83</sup> Ser<sup>87</sup> Asn<sup>88</sup> Thr<sup>90</sup> (SEQ ID NO: 9) EPO. A further analog is darbepoetin alfa. A preferred erythropoietin protein in the use described before is darbepoietin alfa.
